

Simplified maintenance is another advantage of this series. There is easy access to the controllers by simply opening the bonnet and side covers can be detached during maintenance procedures. A liquid crystal display (LCD) alerts the operator when the battery is discharged to 80%, during which time travel and lifting speeds are reduced for longer battery life. The system automatically shuts off the main power to save battery life when the machine is not operated for 15 minutes, even when the key switch is on.

There are approximately 60 failure codes which can be displayed on the monitor panel, which means the operating status of the machine and failure causes are easily identified.

Features for enhanced aesthetics and greater operator comfort include a lower floor with a wider step, a comfortable suspension seat, a small diameter steering wheel for easy control and functionally arranged control levers for comfortable operation. Fingertip controls are an option for demanding applications.

Criterion Equipment, which has been the sole distributor of TCM forklifts in South Africa for nearly 40 years, offers a national technical advisory, spare parts, repair and maintenance service.
